

Genasys™ HazardSense™ with Auto-Discovery

Intelligent Sensor Integration
with AI and Analytics

Seamless Integration

Genasys HazardSense enables seamless integration with physical security system sensors and monitoring devices to initiate event actions, including lockdowns. HazardSense disambiguates and manages disparate sensor events from physical security systems such as access control and fire or gas panels and sends targeted or location-based alerts to at-risk individuals or groups.

AI & Analytics

Dynamically captured events from any monitored physical system are clustered and disambiguated to automatically send alerts to specific locations or to specific groups or teams.

Auto-Discovery

With Auto-Discovery, administrators can locate anyone on a wired or wireless network within a campus, building, floor or zone, even in a basement, regardless of computer pre-registration, email address or phone number.

Event Feedback Lockdowns

Using information from physical system sensors, HazardSense can automatically initiate lockdowns and other life-safety actions as well as issue 'All Clear' notifications when the critical event is over.
